Active Power Grid

The Active Power Grid research group is based on an evolutionary conception of power infrastructures enabling. It occuse efficient and enables automaticates consumers, essenge topoge capabilities, impre-scale energy interconnections, ficultificial workstats, and cross-principation brothures, the research of the group requires collaboration and integration between a wide array of specializations, including power system planning and analysis, the oper schultisc of the APG group address on to the schult and schult and schult and schult pre-schult and analysis, the oper schult schult and schult and schult and schult and schult and schult and schult pre-schult and schult pre-schult and address but address and schult and schult and schult and schult and schult pre-schult and schult pre-schult and schult and schult pre-schult and schult and schult and schult pre-schult and schult pre-schult and schult and schult and schult and schult and schult and schult pre-schult and schult pre-schult and schult and schult and schult and schult and schult and schult pre-schult and schult pre-schult and schult and schult and schult and schult and schult and schult pre-schult and schult pre-schult and schult and schult and schult and schult and schult and schult pre-schult and schult and schult and schult and schult and schult and schult pre-schult and schult and schu ergy systems. These involve co on and automation capabilities in energy grids, heterogeneous energy sources, decentralized generation based on ter science, power processing, digital markets and regulation services. The Main Expertise

Automatic grids
Micro-oride

Micro-grius
Super-grids
Virtual power plants
Power processing
Distributed control systems

Transversal fields data ificial Intelligence (machine learning models) Deep Learning
Cyber-Physical Energy Systems
Software Engineering
Energy Cloud Computing

Research Challenges

 Shifting energy production to renewable and low-carbon sources;
Enabling power converter dominated power systems;
Expanding diplatization among energy systems to achieve previously unseen levels of coordination and optimization;
Exploiting computational advances to spread intelligence throughout the system, from physic-edges to extensive clouds;
Improving power processing capacities of power systems; nowing from detormechanical generation and passive demand to power active convert
Managing bi-directional energy flows, as consumers play an active role in energy supply and demand;
Induccing demand responses and integrating small-scale generation and strassive from the residential and industrial sectors;
Developing new energy conversion options (P2X) and integrating different energy vectors (electricity, molecule-based energy vectors, heating/cool er systems at both the generation and demand si

Application areas

 Renewable energy generation/conversion system
Electric grids and infrastructures
Smart grid technologies
Distributed control systems
Microgrids
Midlit-terminal dc and hybrid ac/dc networks
Power conversion systems
Fenergy storage systems
Fuel-cell conversion systems and electrolysers
Fuel-cell conversion systems
Fuel-cell conversion systems Electric vehicle charging
Energy Internet and digital platforms
Computational energy intelligence

Main assets

• FLEXITRANSTORE - An Integrated Platform for Increased Flexibility in Smart Transmission Grids with Storage Entities and Large Penetration of Renewable Energy Sources. (H2020 / 2017-2021)

Equipment

Three interconnected RT-simulation systems
The interconnected RT-simulation systems
Smart meters, PMU and RTU measurement systems interfaced with RT simulators
Networks controllers supporting multiple communication protocols for edge-control
Cocal HPC for the gracentrol of systems
Cocal HPC for the gracentrol of systems
Power amplifier for HIL
Order amplifier for HIL
Port and battery emulators
Porgrammable loads
Several power conversion systems

Selected publications Al-based Damping of Electromecha
